BIO392 Bioinformatics of Genome Variations

Genomes: Core of "Personalized Health" & "Precision Medicine"

Michael Baudis **UZH SIB**
Computational Oncogenomics

BIO392: Course Schedule

<https://compbiozurich.org/UZH-BIO392/>

	Friday 2025-04-04	Tuesday 2025-04-08	Wednesday 2025-04-09	Thursday 2025-04-10	Friday 2025-04-11	Tuesday 2025-04-15	Wednesday 2025-04-16	Thursday 2025-04-17	Tuesday 2025-04-29	Wednesday 2025-04-30	Friday 2025-05-02	Tuesday 2025-05-06	Wednesday 2025-05-07
09:00 - 10:00	* Room information * Administrative - discuss times/days - exam		Jiahui: Terminal / Unix / Files	Hangjia: R environment introduction	Michael: Genomic Resources & Data Sharing		Feifei: Sequence analysis practical. FastQC, trimmomatic, BWA-MEM2, SAMtools, GangSTR, BCFtools	Michael: Genomic Data & Privacy		Feifei & Ziying: survival	Feifei: population structure		
10:00 - 11:00	Tina Siegenthaler: technical introduction (room, computer, accounts)		Jiahui: Terminal / Unix / Files	Hangjia: R exercise	Michael: Genomic Resources & Data Sharing		Feifei:: Sequence analysis practical	Michael: Genomic Data & Privacy		Feifei & Ziying: survival	Feifei: population structure		Discussion
11:00 - 12:00	* explore course site * create Github accounts and forward to bio392@compbiozurich.org *feifei&jiahui: overall schedule of the course		jiahui: SIB online introduction to Unix		Michael: Genomic Resources & Data Sharing		Feifei:: Sequence analysis practical	Michael: Genomic Data & Privacy		Feifei: survival	Feifei: population structure		
13:00 - 14:00	jiahui: Github	Michael: Introduction	Jiahui & Ziying: Python	Hangjia: CNV paper reading	Hangjia: Clinvar and Clingen	Feifei: Sequence analysis introduction. Overview of pipeline from raw reads -> variant calling & interpretation	Feifei:: STR reading up			Feifei:: analysis & interpretation. Parsing VCF (cvcf2), UCSD genome browser, ENSEMBL variant effect predictor	Feifei: population structure	Feifei & others: Presentation & Discussion	Exam revision, Q&A
14:00 - 15:00	jiahui: Github&Git exercise	Michael: Introduction	Exercise	Hangjia: Progenetix as tool for CNV frequencies etc.	Hangjia: blast	Feifei: Sequence analysis introduction	Feifei:: STR reading up			Feifei:: analysis & interpretation.	Feifei: population structure	Feifei & others: Presentation & Discussion	
15:00 - 16:30		Michael: Introduction			Hangjia: Blast exercise					Feifei:: analysis & interpretation.	Feifei: population structure	Feifei & others: Presentation & Discussion

Genomic File Formats

Types | Sizes | Use Cases

What is a PB, for human genomes?

It depends...

- 2 bits per base are sufficient to encode TCGA
 - using 00, 01, 10, 11
 - [TCGA]{3'000'000'000}
 - $2 * 3 * 10^9 b = 6,000,000,000 b$
 - perfect genome (no overhead): ~715 MB
 - 1PB => ~1'400'000 genomes
- according to Swiss online store (Sep 2021) ~35'000CHF (65x16TB á CHF550)
- this is less than a PhD position per year in Switzerland ...
- (real costs are 2x that, + duplication, facilities, service ... => ~500'000CHF)
- **However: A single 30x BAM file => 100GB**
- Still: 500'000CHF => 1PB => 10'000 genomes => 50CHF/genome (BAM format)

Genomic File Formats

Genomic File Formats

- **text** or **binary** file formats, optimised for specific types of biological data
- examples from genomics:
 - **BAM** - binary version of Sequence Alignment/Map (SAM)
 - CRAM - compressed version of BAM with multiple optimization and differential access options
 - **BED** (Browser Extensible Data) -flexible way to define the data lines in an genome browser annotation tracks
 - **VCF** (Variant Call Format)

■ Axt format
■ BAM format
■ BED format
■ BED detail format
■ bedGraph format
■ barChart and bigBarChart format
■ bigBed format
■ bigGenePred table format
■ bigPsl table format
■ bigMaf table format
■ bigChain table format
■ bigWig format
■ Chain format

BED file example

SAM/BAM and related specifications

These documents are maintained by the Large Scale Genomics work stream of the Global Alliance for Genomics & Health ([GA4GH](#)). Information on GA4GH procedures and how to get involved is [available here](#). Lists of contributors and acknowledgements can generally be found in each individual specification document.

Specifications:

- [SAM v1](#)
- [SAM tags](#)
- [CRAM v2.1](#)
- [CRAM v3.x](#)
- [CRAM codecs](#)
- [BCF v1](#)
- [BCF v2.1](#)
- [CSI v1](#)
- [Tabix](#)
- [VCF v4.1](#)
- [VCF v4.2](#)
- [VCF v4.3](#)
- [VCF v4.4](#)
- [BED v1](#)
- [crypt4gh](#)
- [Htsget](#)
- [Refget](#)

Alignment data files

[SAMv1.tex](#) is the canonical specification for the SAM (Sequence Alignment/Map) format, BAM (its binary equivalent), and the BAI format for indexing BAM files. [SAMtags.tex](#) is a companion specification describing the predefined standard optional fields and tags found in SAM, BAM, and CRAM files. These formats are discussed on the [samtools-devel mailing list](#).

[CRAMv3.tex](#) is the canonical specification for the CRAM format, while [CRAMv2.1.tex](#) describes its now-obsolete predecessor. [CRAMcodecs.tex](#) contains details of the CRAM custom compression codecs. Further details can be found at [ENA's CRAM toolkit page](#) and [GA4GH's CRAM page](#). CRAM discussions can also be found on the [samtools-devel mailing list](#).

The [tabix.tex](#) and [CSIV1.tex](#) quick references summarize more recent index formats: the tabix tool indexes generic textual genome position-sorted files, while CSI is [htslib](#)'s successor to the BAI index format.

Unaligned sequence data files

We do not define or endorse any dedicated unaligned sequence data format. Instead we recommend storing such data in one of the alignment formats (SAM, BAM, or CRAM) with the unmapped flag set. However for completeness, we list the commonest formats below with external links.

[FASTA](#) is an early sequence-only format originally defined by William Pearson's tool of the same name.

[FASTQ](#) was designed as a replacement for FASTA, combining the sequence and quality information in the same file. It has no formal definition and several incompatible variants, but is described in a paper by Cock et al.

Variant calling data files

[VCFv4.4.tex](#) is the canonical specification for the Variant Call Format and its textual (VCF) and binary (BCF) encodings, while [VCFv4.1.tex](#), [VCFv4.2.tex](#) and [VCFv4.3.tex](#) describe their predecessors. These formats are discussed on the [vcftools-spec mailing list](#).

[BCFv1_qref.tex](#) summarizes the obsolete BCF1 format historically produced by [samtools](#). This format is no longer recommended for use, as it has been superseded by the more widely-implemented BCF2.

[BCFv2_qref.tex](#) is a quick reference describing just the layout of data within BCF2 files.

Discrete genomic feature data files

[BEDv1.tex](#) is the canonical specification for the GA4GH Browser Extensible Data (BED) format.

File encryption

[crypt4gh.tex](#) is the canonical specification of the crypt4gh format which can be used to wrap existing file formats in an encryption layer.

Transfer protocols

[Htsget.md](#) describes the *hts-get* retrieval protocol, which enables parallel streaming access to data sharded across multiple URLs or files.

[Refget.md](#) enables access to reference sequences using an identifier derived from the sequence itself.

The VCF file format

Standard for genomic variant representation

Example

VCF header

```

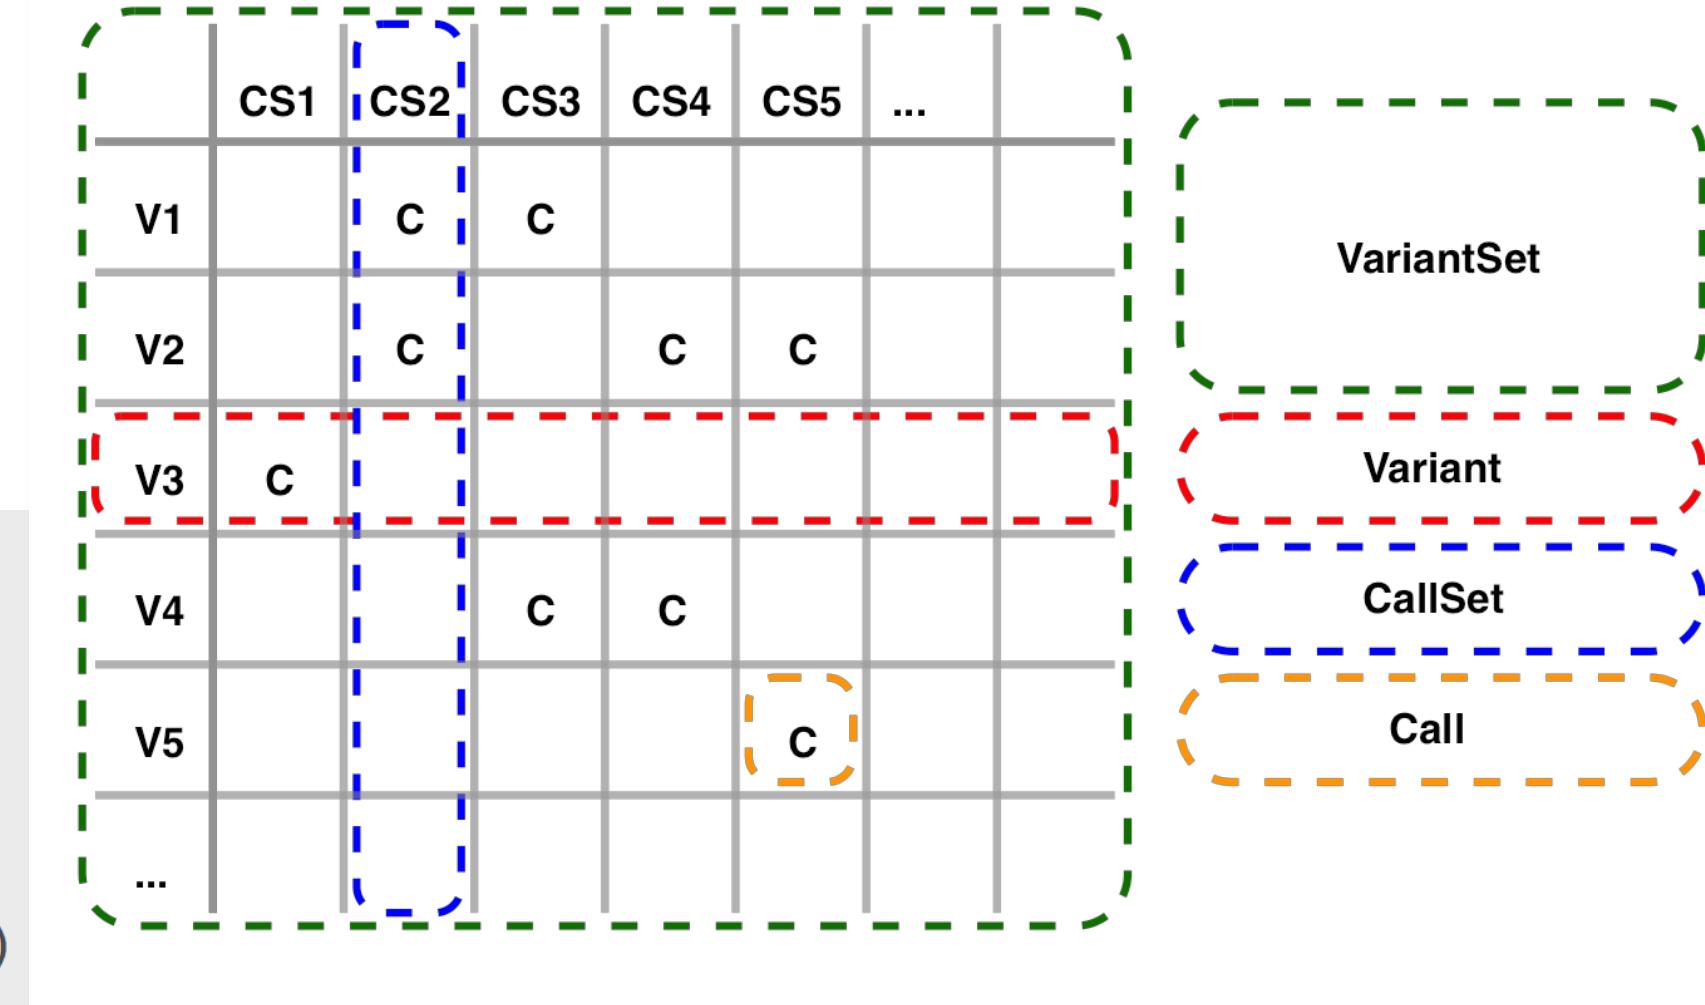

##fileformat=VCFv4.0
##fileDate=20100707
##source=VCFtools
##reference=NCBI36
##INFO=<ID=AA,Number=1,Type=String,Description="Ancestral Allele">
##INFO=<ID=H2,Number=0,Type=Flag,Description="HapMap2 membership">
##FORMAT=<ID=GT,Number=1,Type=String,Description="Genotype">
##FORMAT=<ID=GQ,Number=1,Type=Integer,Description="Genotype Quality (phred score)">
##FORMAT=<ID=GL,Number=3,Type=Float,Description="Likelihoods for RR,RA,AA genotypes (R=ref,A=alt)">
##FORMAT=<ID=DP,Number=1,Type=Integer,Description="Read Depth">
##ALT=<ID=DEL,Description="Deletion">
##INFO=<ID=SVTYPE,Number=1,Type=String,Description="Type of structural variant">
##INFO=<ID=END,Number=1,Type=Integer,Description="End position of the variant">
#CHROM POS ID REF ALT QUAL FILTER INFO FORMAT SAMPLE1 SAMPLE2
1 1 . ACG A,AT .
1 2 rs1 C T,CT .
1 5 . G <DEL> .
1 100 . T .

```

Body

Annotations:

- Deletion**: Variant at position 5 is a deletion ().
- SNP**: Variant at position 2 is a SNP (rs1).
- Large SV**: Variant at position 5 is a large structural variant (SVTYPE=DEL; END=300).
- Insertion**: Variant at position 2 has an insertion (T).
- Other event**: Variant at position 5 is an other event ().
- Mandatory header lines**: Lines starting with ##.
- Optional header lines (meta-data)**: Lines starting with ##INFO or ##FORMAT.
- Reference alleles (GT=0)**: Reference alleles for samples 1 and 2.
- Alternate alleles (GT>0 is an index to the ALT column)**: Alternate alleles for samples 1 and 2.
- Phased data**: Phased data for samples 1 and 2 across the variants.

Variant
Call
Format

- stores the results of a single or multiple interpretations of genome sequencing datasets, in comparison to a reference genome
- standard format for file-based storage of human genome variants

Storage

Task: Estimate Storage Requirements for 1000 Genomes

- How much computer storage is required for 1000 Genomes
 - WES & WGS
 - Different file formats
 - SAM
 - BAM
 - CRAM
 - VCF
 - FASTA
 - Associated costs
 - Cost factors
 - Raw Storage costs

Please provide 1-page size estimates and reasoning for the use of the different file types (i.e. which would you use for storing called variants, which for full archival purposes, browser visualisation), for 3-5 formats.

Submit your files (.md) per pull request to your Github directory.

- Familiarize with VCF format
→specification in article collection

IBM-storage-unit-3500-Schiphol-1957

Please provide 1-page size estimates and reasoning for the use of the different file types (i.e. which would you use for storing called variants, which for full archival purposes, browser visualisation), for 3-5 formats. Submit your files (.md) per pull request to your Github directory.

Task: Reading up on Genome Technologies

- General NGS technologies
- count based vs. intensity based as principle
- long and short read technologies
 - ▶ advantages/applications for either
- dig deeper for some (molecular)-cytogenetic techniques:
 - ▶ banding analysis, SKY, M-FISH
 - ▶ SNP, aCGH arrays
 - ▶ chromosomal CGH
- ➔ notes about usage (research, clinical, historical vs. current)
- "T2T genome"
 - ▶ What technologies enabled this?
- Graph Genomes
 - ▶ Principles?

COSMIC v79, released 14-NOV-16

COSMIC, the Catalogue Of Somatic Mutations In Cancer, is the world's largest and most comprehensive resource for exploring the impact of somatic mutations in human cancer.

Start using COSMIC by searching for a gene, cancer type, mutation, etc. below, or by browsing a region of the human genome using the map to the right.

eg: *Braf, COLO-829, Carcinoma, V600E, BRCA-UK, Campbell* **SEARCH**

R Resources

Key COSMIC resources

- Cell Lines Project

Cancer Gene Census Update

7 genes have been added to the [Cancer Gene Census](#) -

- EPAS1 - Endothelial PAS domain protein 1.
- PTPRT - Protein tyrosine phosphatase, receptor type T.
- PPM1D - Protein phosphatase, Mg²⁺/Mn²⁺ dependent 1D.
- BTK - Bruton tyrosine kinase.
- PREX2 - Phosphatidylinositol-3,4,5-trisphosphate dependent Rac exchange factor 2.
- TP63 - Tumour protein p63.
- QKI - QKI, KH domain containing RNA binding.

For full details, see the [Datasheet](#).

All Curated Genes Gene-Disease Validity Dosage Sensitivity Clinical Actionability Curated Variants Statistics More ?

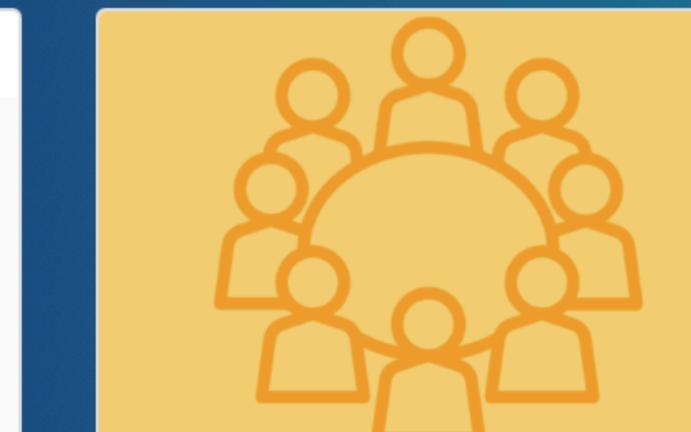

ClinGen is defining the clinical relevance of genes and variants

Founded in 2013 by the National Human Genome Research Institute, ClinGen is a growing collaborative effort, involving three grants, nine principal investigators and over 2,700 contributors from more than 70 countries. Below are a series of recent updates that ClinGen has been working on.

Advancing genomic knowledge through global curation

In Genetics in Medicine, a special article from ClinGen describing the methods of genomic curation and development of software and infrastructure needed to support a global consortium capable of large-scale evidence-based curation.

Volunteer as an Expert

Interested in contributing your expert knowledge and/or data to a ClinGen GCEP or VCEP? Learn more and take our volunteer expert survey.

ClinGen Downloads and APIs

Visit our File Downloads and APIs page for a summary of available ClinGen curation files and API resources.

Volunteer to Curate

Please take a brief survey to tell us more about your interests and desired level of involvement so we can pair you with an appropriate curation activity and/or Expert Panel.

The ClinGen and ClinVar Partnership

Both provide resources to support genomic interpretation

- ▶ ClinVar (an NCBI database/resource) is used as basis for curated variant <-> disease associations in ClinGen
- ▶ ClinGen - a funded project (application/funding limited)
- ▶ ClinVar - an internal NIH resource (dependent on political "goodwill")

ClinGen - A Program

An NIH funded project

Building a central resource that defines the clinical relevance of genes and variants

ClinGen is addressing the following critical questions:

- Is the gene associated with disease?
- Is the variant pathogenic?
- Is the variant/gene information actionable?

Encouraging data sharing

- Promote lab submissions to ClinVar
- Facilitate patient data sharing through GenomeConnect

Assessing the clinical **validity** and **actionability** of genes and their relationship to diseases

ClinVar- A Database

Funded by intramural NIH funding

Freely accessible and downloadable public archive of reports of the relationship between variants and conditions

Maintained by the National Center for Biotechnology Information (NCBI)

Maintaining a publicly available **database** of:

- Interpretations of the clinical significance of variants
- Submitter information
- Supporting evidence and individual level data, when available

Cancer Genome Anatomy Project (CGAP)

The NCI's Cancer Genome Anatomy Project sought to determine the gene expression profiles of normal, precancer, and cancer cells, leading eventually to improved detection, diagnosis, and treatment for the patient. Resources generated by the CGAP initiative are available to the broad cancer community. Interconnected modules provide access to all CGAP data, bioinformatic analysis tools, and biological resources allowing the user to find "in silico" answers to biological questions in a fraction of the time it once took in the laboratory.

The CGAP Website

Interconnected modules provide access to all CGAP data, bioinformatic analysis tools, and biological resources allowing the user to find "in silico" answers to biological questions in a fraction of the time it once took in the laboratory.

Genes Gene information, clone resources, SNP500Cancer, GAI, and transcriptome analysis.

Chromosomes FISH-mapped BAC clones, SNP500Cancer, and the Mitelman database of chromosome aberrations.

Tissues cDNA library information, methods, and EST-based gene expression analysis.

Pathways Diagrams of biological pathways and protein complexes, with links to genetic resources for each known protein.

RNAi RNA-interference constructs, targeted specifically against cancer relevant genes. New addition: Validated set of shRNAs.

Announcements

23/August/2016 - The ICGC Data Coordination Center (DCC) is pleased to announce ICGC data portal data release 22 (<http://dcc.icgc.org>).

ICGC data release 22 in total comprises data from more than 16,000 cancer donors spanning 70 projects and 21 tumour sites.

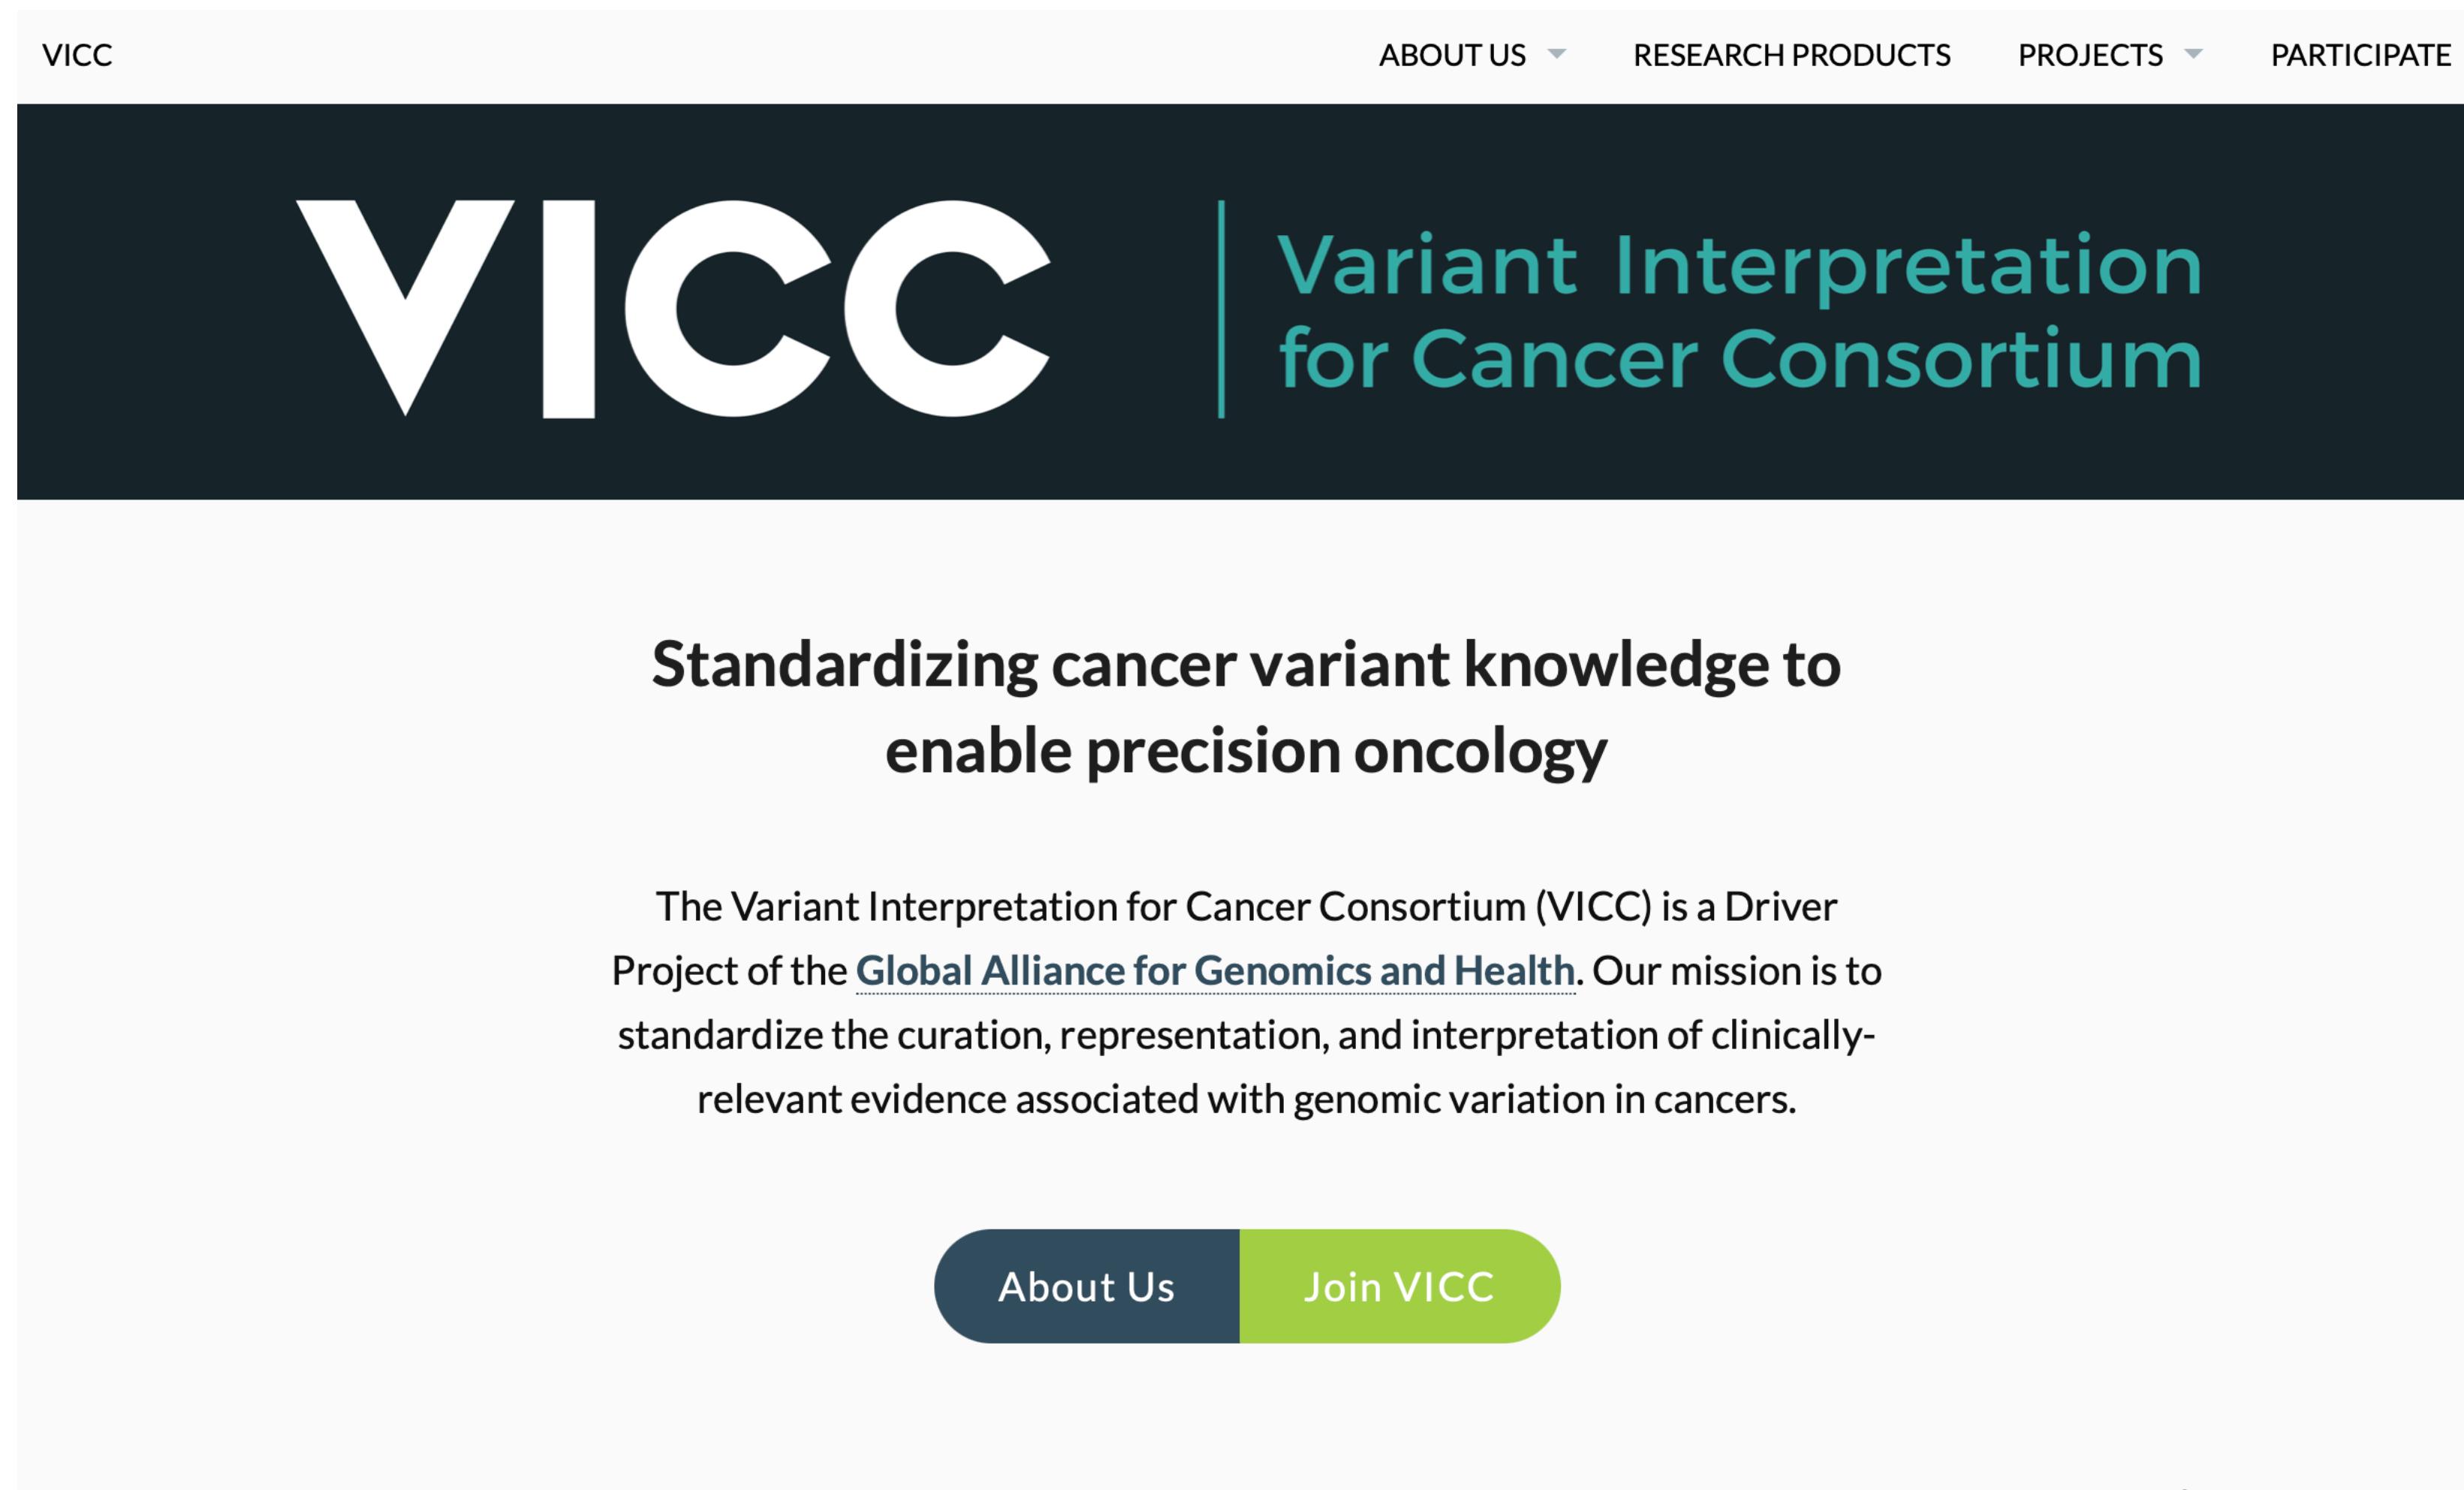

17/April/2016 - ICGCmed is pleased to announce the release of its white paper (<http://icgcmed.org>).

The International Cancer Genome Consortium for Medicine (ICGCmed) will link genomics data to clinical information, health and responses to therapies.

18/November/2015 - The International Cancer Genome Consortium (ICGC) PanCancer dataset generated by the PanCancer Analysis of Whole Genomes (PCAWG) study is now available on Amazon Web Services (AWS), giving cancer researchers access to over 2,400 consistently analyzed genomes corresponding to over 1,100 unique ICGC donors (<https://icgc.org/icgc-in-the-cloud>).

RESOURCES FOR CANCER GENOMICS

- ▶ The field of precision medicine aspires to a future in which a cancer patient's molecular information can be used to inform diagnosis, prognosis and treatment options most likely to benefit that individual patient. Many groups have created knowledgebases to annotate cancer genomic mutations associated with evidence of pathogenicity or relevant treatment options. However, clinicians and researchers are unable to fully utilize the accumulated knowledge derived from such efforts. Integration of the available knowledge is currently infeasible because each group curates their own knowledgebase without adherence to any interoperability standards. Therefore, there is a clear need to standardize and coordinate clinical-genomics curation efforts, to facilitate integration of the knowledge and evidence provided by institutions in academia, government, and industry alike.

The image shows the homepage of the Variant Interpretation for Cancer Consortium (VICC) website. The header features the VICC logo and navigation links for About Us, Research Products, Projects, and Participate. The main title "Variant Interpretation for Cancer Consortium" is displayed prominently in large teal letters. Below the title, a subtitle reads "Standardizing cancer variant knowledge to enable precision oncology". A detailed description of the consortium's mission follows, mentioning it is a Driver Project of the Global Alliance for Genomics and Health. At the bottom, there are two buttons: "About Us" (dark blue) and "Join VICC" (green).

International federation of genomic medicine databases using GA4GH standards

Adrian Thorogood,^{1,2,*} Heidi L. Rehm,^{3,4} Peter Goodhand,^{5,6} Angela J.H. Page,^{4,5} Yann Joly,² Michael Baudis,⁷ Jordi Rambla,^{8,9} Arcadi Navarro,^{8,10,11,12} Tommi H. Nyronen,^{13,14} Mikael Linden,^{13,14} Edward S. Dove,¹⁵ Marc Fiume,¹⁶ Michael Brudno,¹⁷ Melissa S. Cline,¹⁸ and Ewan Birney¹⁹

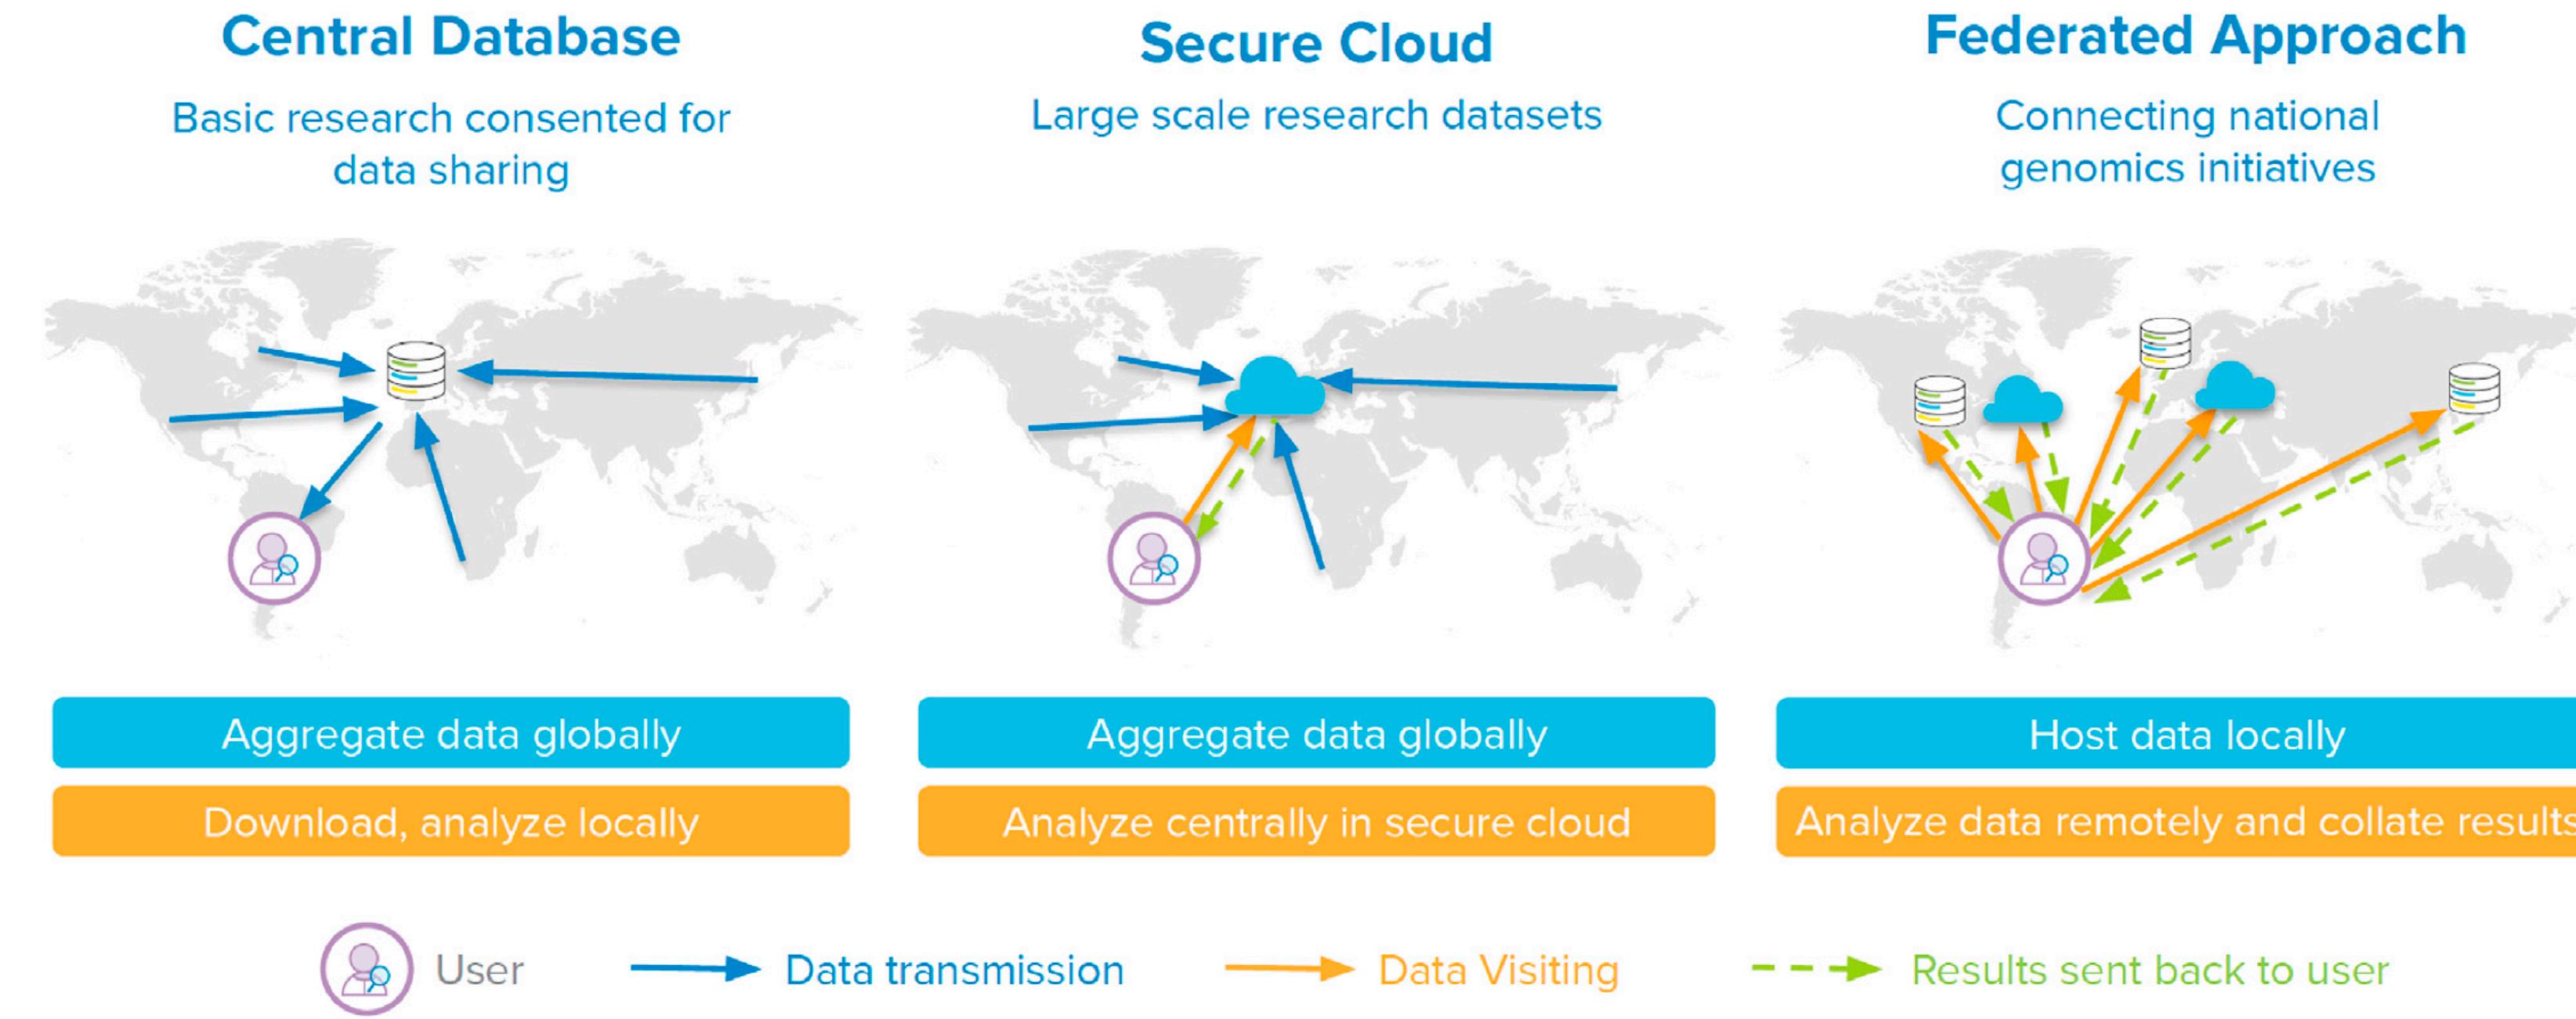

Figure 1. Data sharing approaches: Central database, secure cloud, and federated

Central database: Data from multiple sources are pooled in a central database. Researchers download copies of data and analyze them in their own computing environment.

Secure cloud: Data from multiple sources are pooled in a central cloud environment. Researchers remotely visit data and run their analyses in the cloud and download the result.

Federation: Data remain within locally controlled databases and computing environments, which may be cloud environments. Researchers remotely visit data, run their analyses at each site, and receive a local result, which can then be aggregated.

Task: Exploring Genome Resources

- primary deposition databases
- interpreted databases (e.g. variant annotations...)
- suggestion: VICC paper (Wagner et al.)
 - Wagner et al (2020): A harmonized meta-knowledgebase of clinical interpretations of somatic genomic variants in cancer
- make some notes about different genome resources and their primary use
 - ➡ Don't think only "human" _(__) /

BIO392: Course Schedule

<https://compbiozurich.org/UZH-BIO392/>

	Friday 2025-04-04	Tuesday 2025-04-08	Wednesday 2025-04-09	Thursday 2025-04-10	Friday 2025-04-11	Tuesday 2025-04-15	Wednesday 2025-04-16	Thursday 2025-04-17	Tuesday 2025-04-29	Wednesday 2025-04-30	Friday 2025-05-02	Tuesday 2025-05-06	Wednesday 2025-05-07
09:00 - 10:00	* Room information * Administrative - discuss times/days - exam		Jiahui: Terminal / Unix / Files	Hangjia: R environment introduction	Michael: Genomic Resources & Data Sharing		Feifei: Sequence analysis practical. FastQC, trimmomatic, BWA-MEM2, SAMtools, GangSTR, BCFtools	Michael: Genomic Data & Privacy		Feifei & Ziying: survival	Feifei: population structure		
10:00 - 11:00	Tina Siegenthaler: technical introduction (room, computer, accounts)		Jiahui: Terminal / Unix / Files	Hangjia: R exercise	Michael: Genomic Resources & Data Sharing		Feifei:: Sequence analysis practical	Michael: Genomic Data & Privacy		Feifei & Ziying: survival	Feifei: population structure		Discussion
11:00 - 12:00	* explore course site * create Github accounts and forward to bio392@compbiozurich.org *feifei&jiahui: overall schedule of the course		jiahui: SIB online introduction to Unix		Michael: Genomic Resources & Data Sharing		Feifei:: Sequence analysis practical	Michael: Genomic Data & Privacy		Feifei: survival	Feifei: population structure		
13:00 - 14:00	jiahui: Github	Michael: Introduction	Jiahui & Ziying: Python	Hangjia: CNV paper reading	Hangjia: Clinvar and Clingen	Feifei: Sequence analysis introduction. Overview of pipeline from raw reads -> variant calling & interpretation	Feifei:: STR reading up			Feifei:: analysis & interpretation. Parsing VCF (cvcf2), UCSD genome browser, ENSEMBL variant effect predictor	Feifei: population structure	Feifei & others: Presentation & Discussion	Exam revision, Q&A
14:00 - 15:00	jiahui: Github&Git exercise	Michael: Introduction	Exercise	Hangjia: Progenetix as tool for CNV frequencies etc.	Hangjia: blast	Feifei: Sequence analysis introduction	Feifei:: STR reading up			Feifei:: analysis & interpretation.	Feifei: population structure	Feifei & others: Presentation & Discussion	
15:00 - 16:30		Michael: Introduction			Hangjia: Blast exercise					Feifei:: analysis & interpretation.	Feifei: population structure	Feifei & others: Presentation & Discussion
